### PA.259.CC Genetic Testing

#### Summary

Genetic testing is defined by the National Human Genome Research Institute (NHGRI) as an array of laboratory techniques to examine an individual's DNA (DeoxyriboNucleic Acid).

Genetic testing involves examining DNA, the chemical database that carries instructions for the body's functions. Genetic testing can reveal changes (mutations) in genes that may cause illness or disease.

#### Types of Genetic Testing

1. **Diagnostic testing** is used to precisely identify the disease-causing illness. The results of a diagnostic test may help in making choices about how to treat or manage health.
2. **Predictive and pre-symptomatic genetic tests** are used to find gene changes that increase the likelihood of developing diseases. The results of these tests provide information about the risks of developing specific diseases and may be useful in making decisions regarding lifestyle and healthcare.
3. **Carrier testing** is used to find individuals who "carry" a change in a gene linked to disease. Carriers may show no signs of the disease; however, they have the ability to pass on the gene change to their children, who may develop the disease or become carriers themselves. Some diseases require a gene change to be inherited from both parents for the disease to occur. This type of testing is usually offered to those who have a family history of a specific inherited disease or who belong to certain ethnic groups that have a higher risk of specific inherited diseases.
4. **Prenatal testing** is offered during pregnancy to help identify fetuses that have certain diseases. Newborn screening is used to test babies one or two days after birth to find out if they have certain diseases known to cause problems with health and development.
5. **Pharmacogenomic testing** provides information about how certain medicines are processed by the body. This type of testing can help healthcare providers choose the medicines that work best with an individual's genetic makeup.
6. **Genome Sequencing** When genetic testing doesn't lead to a diagnosis, but a genetic cause is still suspected, genome sequencing may be required. Genomes are

unique, made up of the DNA in all genes. This complex testing can help identify genetic variants that may relate to health. This testing is usually limited to just looking at the protein-encoding parts of DNA called the exome.

### Clinical Criteria

CountyCare considers genetic testing medically necessary to establish a molecular diagnosis of an inheritable disease when all of the following are met:

1. The member displays clinical features, or is at direct risk of inheriting the mutation in question (pre-symptomatic); and
2. The result of the test will directly impact the treatment being delivered to the member; and
3. After history, physical examination, pedigree analysis, genetic counseling, and completion of conventional diagnostic studies, a definitive diagnosis remains uncertain; and
4. Disease-specific criteria met.

To ensure that genetic testing requested and being paid for by CountyCare are medically necessary, (**See PA.252.CC Determination of Medical Necessity for full details**) the following guidelines listed in order of significance below are used to make medical necessity decision on a case-by-case basis, based on the information provided on the member's health status

- 1<sup>st</sup> State law/guidelines (e.g., when State requirements supersede or exceed federal requirements)
- 2<sup>nd</sup> CountyCare developed and/or approved medical policies.
- 3<sup>rd</sup> If no Plan policies exist, then InterQual Clinical Decision Support Criteria
- 4<sup>th</sup> For Clinical Trials CountyCare considers routine care costs of members in Clinical Trials as medically necessary in accordance with: *PA.078.CC Clinical Trials*)
- 5<sup>th</sup> In the case of no guidance from above, additional information that the applicable Health Plan Medical Director will consider and includes:

- Medical necessity definition as supported by the Plan.
- Reports from peer reviewed medical literature, from which a higher level of evidence and study quality is more strongly considered.
- Evidence-based guidelines published by the American Board of Medical Specialties and other medical associations.
- Nationally recognized organizations such as National Guideline Clearinghouse,
- Professional standards of safety and effectiveness recognized in the US for diagnosis, care, or treatment.
- Nationally recognized drug compendia resources such as Facts & Comparisons® (NCCN, DRUGDEX®, and The National Comprehensive Cancer Network®) Guidelines.

- Government-funded or independent entities that assess and report on clinical care decisions and technology such as Agency for Healthcare Research and Quality (AHRQ), Hayes Technology Assessment, Up-To-Date, Cochrane Reviews, National Institute for Health and Care Excellence (NICE), etc.

### Coverage Determinations for Genetic Testing

CountyCare will use the following as guidelines to determine the medical necessity of specific items and services:

- Consistent with the symptoms or diagnoses of the illness or injury under treatment
- Necessary and consistent with generally accepted professional medical standards as outlined in this policy
- Not furnished primarily for the convenience of the patient, caregiver, the attending physician, or another physician or supplier
- Furnished at the most appropriate level that can be provided safely and effectively to the patient
- Evidence that a similar outcome cannot be achieved through a lower-cost medically necessary alternative

### Limitations

1. Depending on the test, it may only be allowed once during the member's lifetime per disease for diagnostic purposes
2. A second genetic test may be authorized in one of the following circumstances:
  - a. The genetic test identifies other mutations not previously tested and is different from the original test
  - b. The genetic test measures gene expressions or identifies somatic mutations which can vary over time, when clinically appropriate

### Cross Reference Policies

- PA.018.CC Gene Expression Testing for Breast Cancer
- PA.249.CC noninvasive Genetic Testing During Pregnancy
- PA.252.CC Determination of Medical Necessity

### Codes

**The following list of procedure codes is not all inclusive. Listing of a code in this policy does not imply that the service is a covered/non-covered health service. Benefit coverage is determined by the member's benefit plan document in effect at the time of service and applicable laws that may require coverage for a specific service. The inclusion of a code does not imply any right to reimbursement or guarantee claim payment. Other CountyCare Policies and Guidelines may apply.**
